

Bring-In-Service

Service description

In this service-package the data destruction will be effected by our hard disk-shredder in our alarm-secured Recyclingcenter in Eppishausen.

If you desire your responsible staff can personally monitor the data destruction and can document the data destruction process in written form together with our colleague.

You can choose between the following Service-Packages:

- **Standard-Service:** The destruction of data medium, which include data with normal protection requirements, will be effected with our shredder in processing stage 1. This shredder cuts the hard disks in small strips. The results are particle sizes between 300 mm² and 900 mm².

The recommendation of the Federal Office for Information Security (German: BSI) is a particle size till 1,000 mm² after the destruction.

- **Premium-Service:** The destruction of data medium, which include data with high protection requirements, will be effected afterwards additionally with a secondary crushing through our shredder in processing stage 2. This shredder is equipped with a single shaft and an additional strainer insert. The results are particle sizes of max. 225 mm².

The Federal Office for Information Security (German: BSI) recommends for hard disks, which include data with high protection requirements, a particle size till 300 mm² after the destruction.

Due the higher storage density of hard drives and storage media, it is recommendable to align the process to the smallest possible particle sizes in the mechanical hard drive destruction.

If you desire your responsible staff can personally monitor the data destruction and can document the data destruction process in written form together with our colleague.
